

SUMMARY

- Embedded Linux engineer with ~9 years taking connected products from board bring-up through secure, field-updatable deployment.
- Yocto distributions, BSP and kernel work, CI/CD, and hardware-in-the-loop test.
- Product cybersecurity (EN 18031 / EU RED, secure boot, SBOM) and OTA update systems.
- Electrical Engineering graduate with honors distinction.
- Open to hybrid and remote roles.

SKILLS

Embedded Linux: Yocto Project, BitBake, BSP, Linux kernel drivers and config, U-Boot, i.MX8 (IMX8DXL), cross-compilation SDKs

Security & Updates: secure boot, signed firmware images, threat modeling, secure element key management, SBOM, EN 18031 / EU RED, CRA, RAUC OTA, A/B partitioning

Build, CI & Test: Docker, Jenkins, Git, GitOps, Gitflow, HIL testing, Labgrid

Debug & Hardware: JTAG/SWD, GDB, logic analyzer, oscilloscope, CAN bus, cellular modems, WiFi, Bluetooth/BLE, STM32, nRF52, FPGA/Verilog

Tools & Middleware: Vim, GNU tools, shell scripting, DBus, REST, GObject, Jira, Puppet

EXPERIENCE

Senior Software Engineer

Apr 2024 – Present

PTx, AGCO's Precision Agriculture Technology business

- Develop embedded Linux platforms for agricultural equipment electronics; working knowledge of CAN bus and protocol.
- Applied EN 18031 (EU RED cybersecurity) to a connected product: asset identification, decision-tree assessment, and evidence for third-party certification; tracking CRA readiness.
- Implemented secure boot and signed firmware images; performed threat modeling and key management backed by a hardware security element.
- Generate and maintain SBOMs for a Yocto-based product.
- Implemented RAUC OTA updates across multiple A/B and asymmetric partition layouts: U-Boot integration, secure boot fallback handling, recovery from failed kernel, rootfs, and application updates, and the tests to prove it.
- Build and deliver containerized applications that run on embedded targets.
- Integrated AI-assisted development into daily embedded workflow for code generation, review, test authoring, and documentation, with defined boundaries on where generated code is not trusted without verification.

EDUCATION

**BS Electrical Engineering,
Minor in Software Engineering**
South Dakota State University
2012 – 2017

LANGUAGES

Bash (~10 years)

Python (~8 years)

C++ (~9 years)

C (~7 years)

Dockerfile (~5 years)

Java for Android (~1 year)

INTERESTS

hobby-electronics, home
automation, embedded-linux
ice and rock climbing
snowboarding and skiing
gardening, cooking
jetskiing, boating, water skiing
camping, kayaking, volleyball

Senior Software Engineer

Dec 2021 – Apr 2024

ESW Team at Appareo Systems (acquired by AGCO, Jan 2022)

- Performed board bring-up for custom PCB with heterogeneous SOC (IMX8DXL), debugging with JTAG/SWD, GDB, logic analyzer, and oscilloscope.
- Integrated drivers for cellular modems, WiFi, and bluetooth.
- Setup dockerized Jenkins with manual and GitOps centric builds, using Gitflow with automated build and deployment of releases.
- Developed and utilized HIL testing with Labgrid on RPI4.
- Generated SDKs and docker images for quick cross-compilation of C++ Applications.

Software Engineer 1

May 2017 – Dec 2021

System Team at Vaddio

- Working with FPGA and python developers to create an integrated embedded system that routes audio and video signals in professionally built AV systems.
- I help to build a custom Linux distribution from the '/' up with the Yocto Project.
- Our team uses many other tools during development such as Jenkins, Jira, Git, Bitbake, and Puppet.

Software Engineer

Nov 2018 – Dec 2021

Dojo Five

- Develop embedded software for Particle, Nordic, and STM32 microcontrollers
- Utilized custom hardware with the Particle platform for a custom door access solution
- Developed with NRF52 SDK to create devices in a complex robotic system with BLE services

Embedded Linux and OTA Experiments

Ongoing

Personal projects, self-directed

- Compared Mender and OSTree against RAUC to understand A/B, atomic, and rollback-safe update strategies, and authored a custom update agent to work through the trade-offs first hand.
- Managed device fleets with Balena: provisioning, remote access, and delivery of containerized applications to embedded targets.

PROJECTS

Hardware Integrated Prototyping Environment at SDSU Engineering

Expo - Nathan Genetzky, Jordan Ulmer, Tanner Johnson (SDSU, 2017)

Design and Verification of a SPI to JTAG Interface Adapter - Nathan Genetzky, Jordan Ulmer (SDSU, 2017)

Interactive User Interface with PIC18 Microcontroller - Nathan Genetzky, Drake Jenö (SDSU, 2017)

Particle Projects - Firmware for micro controllers sold by particle.io for use with wifi or cellular cloud devices.
